

Druyan Admin iPhone App - Step by Step

1) What was implemented in code

- Capacitor iOS app wrapper was added.
- Native biometric lock (Face ID / Touch ID) was added for /admin.
- Native push registration was added and token is shown in admin settings.
- App startup on native now opens directly to /admin.
- iOS AppDelegate push callbacks were added.
- iOS Info.plist includes Face ID usage description.

2) Project files added/updated

- capacitor.config.ts
- src/lib/nativeAdmin.ts
- src/app/pages/Admin.tsx
- src/main.tsx
- ios/App/App/AppDelegate.swift
- ios/App/App/Info.plist
- package.json scripts

3) Commands to run after every web change

1. npm run mobile:build
2. npm run mobile:ios

4) First-time iPhone run

1. Open Xcode via: npm run mobile:ios
2. In Xcode: select signing team for target "App"
3. Enable capability: Push Notifications
4. Build and run on real iPhone (not simulator for push token)

5) What happens in the app

- App opens to /admin automatically on native.
- After login, biometric unlock prompt appears.
- In Settings tab, you can refresh/copy push token.

6) Push setup notes

- APNs key/cert must be configured in your notification provider backend.
- This app generates token and asks permissions. Sending notifications requires backend/provider integration.

7) Troubleshooting

- If plugins changed: npm run mobile:sync
- If iOS build fails: in ios/App run "pod install" only if your setup uses Cocoa Pods.
- If old JS shows: clean build in Xcode + rerun npm run mobile:build
